Dialed

How to use

Log espresso shots and pour over brews, track your beans, and dial in faster.

What is inside

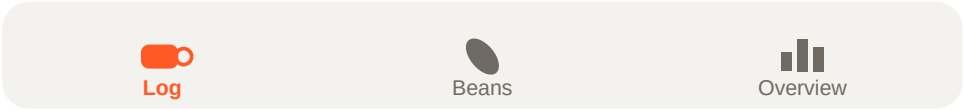
1 Quick start
2 Beans
3 Log an espresso shot
4 Pour over recipes
5 Overview and charts
6 Dialing in cheat sheet
7 Settings, sync and backup
8 Tips and answers

1. Quick start

Dialed is a coffee log that lives in your browser. You save your beans once, log each shot in a few taps, and the app shows what to change next.

1	**Add a bean** Open the **Beans** tab. Enter the name, roast and purchase date. Add the roast date, bag weight and price if you want bag tracking and cost per shot.
2	**Log a shot** Open the **Log** tab, pick the bean, and enter dose, yield, time and grinder clicks. Tap how it tasted, then **Log shot**.
3	**Read the result** You land on **Overview**. The Latest shot card compares your time and ratio with the target ranges and suggests what to try next.
4	**Repeat and improve** Tap **Use these settings** on the suggestion, pull the next shot, and star the best one so you can repeat it.
5	**Back up your data (optional)** Connect GitHub from the gear icon so your log syncs between devices. See section 7.

The three tabs



Log is where you record a brew. **Beans** holds your bean profiles. **Overview** shows your latest shot, charts and the full shot list. The **gear icon** in the top right opens settings.

> **Where is my data kept?**
> Everything is saved in your browser on the device you use. Nothing is uploaded unless you connect GitHub sync. Clearing your browser data on that device deletes the log, so connect sync or export a backup (section 7).

2. Beans

Every shot belongs to a bean. Create the profile once, then just pick it when you log.

Add a bean

Field	What to enter
Bean name	For example: Ethiopia Guji, Origin Roasters.
Date of purchase	When you bought the bag.
Roast date (optional)	Use the date printed on the bag. When set, the app counts days since roast instead of days since purchase, which matters more for taste.
Roast	Light, Medium or Dark.
Bag weight and price (optional)	Turns on remaining weight, low-bag warnings and cost per shot. Use the buttons and quick picks (100, 250, 500, 1000 g) or type it.
Flavour tags (optional)	Tap chips such as Chocolate, Fruity, Nutty, Toffee, Wine, Berry, Malty and Hazelnut.

Each bean card

- **Log shot** jumps to the Log tab with that bean selected.
- **Finish** marks the bag as done. Its age stops counting, the card goes grey, and you can no longer log shots to it. Use **Edit** and clear the Finished date to reopen it.
- **Edit** changes any detail. **Delete** asks you to tap twice, because deleting a bean also deletes all its shots.
- The bag meter turns red when about 15% of the bag is left, or less than three shots remain.
- Use the **All / New beans / Finished** filter. Both groups are sorted newest first.

> **Best shot and good-shot average, per bean**
> Once you star a best shot or rate shots 4 or 5, the card also shows those settings. They belong to that bean only and are never suggested for another bean.

3. Log an espresso shot

Open the **Log** tab and make sure the switch at the top says **Espresso**.

Input	Notes
Bean	Pick from your active beans. The roast, dates and bag left show underneath. The form fills in your last shot of that bean.
Dose in (g)	Coffee in the basket. Use - and + (0.1 g per tap) or the quick picks 16 to 20 g. Hold a button to repeat.
Yield out (g)	Liquid in the cup. - and + change by 0.5 g. The ratio buttons (1:1.5, 1:2, 1:2.5) fill in the grams for your dose.
Time (s)	Shot time from first drip or pump start, whichever you use consistently.
Grinder clicks	Your grinder setting. Only compare clicks on the same grinder.
Drink	Black or White, for how you serve it.
Taste	Sour, Balanced, Bitter or Diluted. This drives the next-shot suggestion.
Rating (optional)	1 to 5. Shots rated 4 or 5 build the good-shot average.
Notes	Anything you want to remember.

The live bar

Below the form, ratio, flow rate (g/s), days since roast and cost per shot update as you type. On a phone this bar and the **Log shot** button stay pinned above the tab bar.

After you log

A confirmation pill appears at the top, the shot time is saved automatically, and you go straight to **Overview**.

Targets for this bean

If the bean has a best shot or a good-shot average, they appear under the bean name with a **Use** button that fills dose, yield and clicks.

Fix a mistake

Open Overview, find the shot, and tap **Edit**. Change anything and tap **Save changes**. The original date and time are kept.

> **Plan your next shot**
> Leave the time empty after tapping Use. You enter the time once the shot has finished.

4. Pour over recipes

Switch the Log tab to **Pour over**. Tap a recipe card to open it. Only the recipe you choose is shown, and the app remembers your last pick.

	Tetsu Kasuya 4:6	James Hoffmann V60	Scott Rao-style V60
Focus	Sweetness, acidity and strength control	Balanced extraction and clarity	Even extraction and sweetness
Coffee	20 g	30 g	22 g
Water	300 g	500 g	360 g
Ratio	1:15	1:16.7	1:16.4
Temperature	92-93 C	100 C for light roasts, lower for darker	96 C
Grind	Medium-coarse to coarse	Medium-fine	Medium-fine
Finish	3:30-3:45	3:00-3:30	4:00-4:30

Scale a recipe

Every open recipe has **Coffee (g)** and **Water (g)** boxes with - and + buttons. Change either one and the other follows, because the ratio stays the same. The coffee and water specs, every pour amount, the running water totals and the numbers in the technique note all recalculate. Quick picks give half, the original, one and a half times, and double.

Pour schedules

Kasuya	Hoffmann	Rao-style
0:00 Pour 60 g (60 g) 0:45 Pour 60 g (120 g) 1:30 Pour 60 g (180 g) 2:15 Pour 60 g (240 g) 3:00 Pour 60 g (300 g) 3:30-3:45 Drawdown ends	0:00 Bloom 60 g 0:00-0:45 Wait 0:45 Pour to 300 g about 1:15 Pour to 500 g 1:15-1:45 Gentle swirl 3:00-3:30 Drawdown ends	0:00 Bloom 44 g 0:05 Stir gently 0:30 Continuous pour to 360 g by 1:30 Pouring done 1:35 Stir both ways 1:45 Swirl 4:00-4:30 Drawdown ends

Technique notes
Kasuya: pour gently in circles and let the water drain between pours. For a sweeter cup try 50 g then 70 g. **Hoffmann:** keep the pour controlled and swirl gently to level the bed. **Rao-style:** stir and swirl to spread the water evenly instead of making several separate pours.

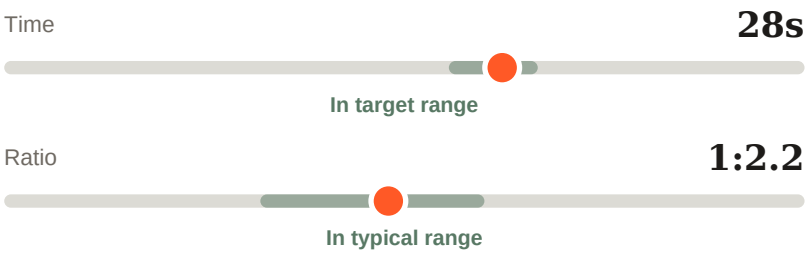
Scaling resets to the original recipe when you pick another recipe. Pour over is a recipe reference for now, so brews are not saved to the history.

5. Overview and charts

Everything you have logged, in one place. Open it from the tab bar, or you arrive here after logging a shot.

Latest shot

A card for your most recent shot with the bean, date, time and days since roast. Two gauges compare it with the usual targets:



- The green band is the target: **25 to 30 seconds** and a ratio of **1:1.8 to 1:2.5**. The orange dot is your shot.
- A line compares it with your previous shot of the same bean, for example Time +9s, Yield +4g, Clicks -2.
- **Set best** stars the shot as that bean's best. **Edit** opens it for changes.
- The **Next shot** box suggests what to change and has a **Use these settings** button (see section 6).

Last 7 days

Shots pulled, favourite bean, average ratio and rating, plus the value of beans used if you entered prices.

Charts

Chart	Shows
Time, Ratio, Yield, Clicks	Each shot over time. A shaded band marks the target range. With one bean selected, a dashed orange line marks your best shot.
Sweet spot	Clicks across, seconds up, each dot coloured by taste. Choose one bean in the filter. Your best shot has an orange ring.

Dot colours: yellow Sour, green Balanced, purple Bitter, blue Diluted. Line charts show the latest 60 shots to stay fast, and averages use all of them.

Filters and the shot list

- Filter by **bean**, **taste** and **rating**. The chart, averages and list all follow the filters.
- The list shows the latest 30 shots. Tap **Show 30 more** for older ones.
- Each shot has **Set best**, **Edit** and **Delete**.

6. Dialing in cheat sheet

The Next shot box follows these rules. Use them as a starting point and change one thing at a time.

What you got	Try next
Sour and fast (under 25 s)	Grind finer by about 2 clicks.
Sour and slow (over 30 s)	Keep the grind and add about 3 g of yield.
Sour, normal time	Add 2 g of yield and go 1 click finer.
Bitter and slow	Grind coarser by about 2 clicks.
Bitter, normal time	Take 2 g off the yield and go 1 click coarser.
Diluted and fast	Grind finer by 2 clicks and shorten the yield by 2 g.
Diluted, other	Shorten the yield by about 3 g, or raise the dose by half a gram.
Balanced, rated 4 or 5	Keep the settings and star it as your best shot.
Balanced, time outside 25 to 30 s	Move 1 click towards the range.
No taste entered	Fast: go finer. Slow: go coarser. Taste it and log the result for a sharper suggestion.

Clicks and grinder direction

Grinders differ: on some, more clicks means coarser, on others finer. Open the gear page and set **More clicks = coarser** or **finer** so the suggested click numbers go the right way.

Good habits

- Change one variable per shot, usually grind first, then yield.
- Weigh dose and yield every time. Ratios only help if the numbers are honest.
- Always tap a taste. The suggestions are much better with it.
- Rate the shots you love. They feed the good-shot average for that bean.
- Beans change as they age. Compare shots by days since roast, not just by date.

> **Targets are a guide**
> 25 to 30 seconds and 1:1.8 to 1:2.5 suit most medium-roast espresso. A white drink, a lighter roast or a long ratio can be correct outside them. Trust your taste.

7. Settings, sync and backup

Tap the **gear icon** in the top right. Tap it again to go back.

Setting	What it does
Appearance	Dark or Light. Dark is the default. Your choice is remembered on that device.
Currency symbol	Used for cost per shot and the weekly summary.
Grinder direction	Tells the suggestions whether more clicks is coarser or finer.
Show the quick guide again	Replays the first-visit walkthrough.
Sync with GitHub	Saves your log to a private GitHub repo so devices stay in step.
Backup	Export JSON (a full copy), Export CSV (for spreadsheets), or Import JSON.

Set up GitHub sync

1. **Create a private repo**
   On GitHub, make a new **Private** repository, for example *espresso-data*, with a README so it is not empty. Do not use your public site repo.
2. **Create a token**
   GitHub, Settings, Developer settings, Fine-grained tokens. Choose **Only select repositories** and pick that repo. Set **Contents** to **Read and write**. Pick an expiry date and copy the token once.
3. **Connect the app**
   Open the gear page. Enter *yourname/espresso-data* as the repo, leave the file path blank, paste the token, and tap **Save and sync**.
4. **Check the footer**
   It should read **Synced to GitHub**. A file called espresso-log.json appears in your data repo.
5. **Repeat on other devices**
   Enter the same repo and token on each device. The token is not synced, so each device needs it once.

- It pushes about a second after each change, and pulls when you open the page or return to the tab.
- Two devices at once are merged so shots are not lost, and deletes carry across.
- It works offline: changes sync the next time you open the app with a connection.
- Your repo history keeps older versions of the file as a backup.

> **Keep the token safe**
> It is stored in that browser only. Use a token limited to the one data repo. When it expires the footer says GitHub rejected the token. Your data stays on the device, and syncing resumes once you paste a new token.

8. Tips and answers

Add it to my phone home screen

iPhone: open it in Safari, tap Share, then Add to Home Screen. Android: open it in Chrome, then the menu, then Install app or Add to Home screen. It opens full screen. There is no offline mode, so you need a connection to open it, but everything you have logged stays saved on the device.

I logged a shot with the wrong numbers

Overview, find the shot, tap Edit, fix it, and save. Its original time is kept.

I finished a bag

Beans tab, tap Finish on the card. The age stops counting and the bean leaves the Log dropdown. Its shots stay in your history and charts.

I switched grinders

Clicks are not comparable between grinders. Add beans for the new grinder as new bean profiles, or note it in the shot notes.

My bag weight looks wrong

Remaining weight is the bag weight minus the dose of every shot logged for that bean. If you started tracking part way through a bag, enter the weight that was left at that point.

Nothing is syncing

Check the footer message. Common causes: the token expired, the repo name has a typo, or the token was not given Contents read and write on that repo.

I cleared my browser data

If sync was on, enter your repo and token again and the log comes back. If not, import the last JSON backup. Export one now and then if you do not use sync.

The page does not zoom or slide sideways

That is on purpose, so it feels like an app. Text and buttons are sized for phones.

Can I share it with a friend?

Yes. Send them the link. Each person has their own separate log on their own device. They should connect their own data repo if they want sync.

Enjoy dialing in.
